

The DIY Zoning Project

1. Welcome

The DIY Zoning Project is a repository containing the information about architecting, designing and implementing the Do It Yourself Temperature Zoning system, introductory course for those planning to install a ready-made [temperature zoning](#) system, and those who just want their home comfort.

2. Mission Statement

Primary: To beat existing temperature zoning systems by price and feature set. Ambitious, isn't it?

Secondary: Educate people so they don't fall victims to unscrupulous contractors.

3. Brief History

The project was born out of a total and absolute frustration which in turn was a result of a fruitless search of information about [existing](#) temperature zoning solutions. The only information available on the zoning system manufacturer web sites was usually "call us for an estimate". The estimates were usually being performed by salespeople. Technical people were difficult to get. Read the [complete story](#) for details.

And remember: An amateur built the Ark. Titanic was built by professionals.

Note:

This site has recently gone through a redesign. Mistakes and omissions are possible, so if you don't find something you know is there, take a look at the old site: <http://diy-zoning.sourceforge.net/old/>.
